

# 'Marking the Future'

- Ready-to-use highly concentrated liquid paint
- No water, no mixing and no pouring required
- Huge reduction in water consumption
- A standard football (soccer) field can be over-marked from as little as 1 litre
- Superb coating of both sides of the leaf blade
- 10 minute drying time under normal conditions
- Paints are available for turf, hard surface and synthetic grass and can all be applied using the Eco Pro Machine

## The Paint

**Impact Eco is the most advanced, ready-to-use, line marking paint formulation that raises the standard of sports field line marking. No mixing, measuring or dilution of the paint is required.**

Water is an increasingly precious commodity. Unlike dilutable paints, the outstanding benefit of using Impact Eco is that no water is required for mixing as the paint is applied directly from the container.

Impact Eco is a highly micronised formulation of titanium dioxide combined with special binders, providing unequalled coverage of the target surface, allowing the operator to over-mark a standard size football (soccer) field from as little as 1 litre of paint.

The fine atomisation of the spray droplets ensures the paint adheres strongly to both sides of the leaf blade. Special pigmentation attributes provide a bright, white reflective surface increasing in visual intensity as the paint dries to give an exceptional line.

In addition, the formulation offers a high level of rain fastness that is durable under a wide range of climatic and ground conditions.

## The Nozzle

The specially engineered nozzle has been developed to match the desired atomisation characteristics of the Impact Eco Paint. This integration of paint formulation with nozzle design and performance is a major advance in line marking application.

## Eco Pro Line Marking Machine

- Designed for use with Impact Eco ready-to-use paint
- High pressure system for consistent paint application
- Consistent application enables more accurate costings per field
- Removable battery for flexible re-charging options
- Accessibility to all parts allowing very easy maintenance

## The Machine

**An advanced spray marking machine, offering speed and flexibility of application.**

The Eco Pro machine provides a high pressure delivery of Impact Eco paint to the target surface to produce consistent, bright lines every time.

Sophisticated in design, yet simple to operate. It is straightforward to maintain and has many advanced features such as a high pressure pump, pre-drilled disc spacers and removable paint pod. The battery can be easily removed and charged away from the machine if required.

The Eco Pro is a dual purpose spray machine. It can be used to apply ready-to-use Impact Eco paint direct from its container. It can also be quickly converted into a dilutable spraying machine. A special pod has been designed that simply drops onto the existing tray. The probe then screws into the pod and the paint is then ready for spraying.

The Eco Pro can hold two 10 litre paint containers. This could allow the operator to over-mark up to 20 standard sized football (soccer) fields without returning to a central base. In the case of a conventional machine applying dilutable paints, the operator may need to return up to ten times for re-filling and mixing and would need to have an available water supply.

Can over-mark up to 20 soccer fields without re-filling!

## The Packaging

Easy to handle and easy to store square 10L plastic containers or square 10L bag-in-a-box packaging options

Paint is applied direct from the container, no mixing needed

Minimises Health & Safety issues involved with containers

Two packaging options for white paint provide choice for disposal and the environment

Packaging and application method allows users to become more water wise and friendly to the environment

Square (cube) shaped packaging allows for cost effective freighting of paint and easy storage in the shed (space saving)

**Impact Eco liquid paint comes in a 10 litre plastic container (all colours) or a 10 litre bag in a box container (white only).**

The 10 litre packaging minimises any health and safety issues surrounding heavy lifting. The square 10 litre plastic container has a top handle and is very easy to move around and store – it is also made from recyclable plastic. The square 10 litre bag-in-a-box has a cardboard outer with built in carry handles that is fully recyclable and can be disposed of in standard recycling bins. The heavy duty plastic bladder (inner) is a very strong material that can be disposed of in standard refuse. Both packaging options allow the paint to be applied direct to the target surface with no mixing, pouring or water needed.

## The Environment

The unique ready-to-use paint means no mixing which means no water for diluting paint, saving money and conserving water

Impact Eco paint liquid is biodegradable

Two recyclable packaging options, reducing waste

Reduction in ordering and deliveries reducing carbon footprint associated with logistics and reducing storage and delivery costs

**The Impact Eco line marking system has been developed with groundsmen and the environment in mind.**

Over a twenty week season for one standard football (soccer) field traditional dilutable paints can use up to 240 litres of water (not including cleaning water). The fully biodegradable Impact Eco line marking paint needs no added water which is a 100% water saving.

## Leaf Coverage

**Impact Eco's finely micronised paint formulation combined with the specially engineered Impact nozzle technology atomises the paint to deliver very fine paint particles to the target surface.**

Delivery of finer particles result in a wider surface area and a better coverage of the leaf blade

Finer particles allow the paint to stick to the leaf blade rather than running down the leaf into the soil profile

Having a finer particle that sticks to the leaf blade allows for a much better durability and water resistance

**Impact**

**Traditional Method**

## The Line Marking System

Gives measurable time and financial savings

No mixing, no water, no pouring, no mess

Over marking a standard football (soccer) field can be done from as little as 1 litre of Impact Eco paint

Much friendlier to the environment

Multi surface applications
